

CLAIMS

1. An I.S. machine including a blow station for forming a bottle from a parison having a formed finish portion comprising
- 5 a blow station including a blow mold having side and bottom portions for supporting a parison, a source of forming air, valve means for selectively connecting the source of forming air to the blow mold to form the parison into a bottle,
- 10 heat sensor means for generating a parison at bottom of mold signal, and control means for operating said valve means to connect the source of forming air to the blow mold based on the time when the parison at bottom of mold signal occurs.
- 15
2. An I.S. machine according to claim 1, wherein said heat sensor means is a thermocouple.
- 20
3. An I.S. machine according to claim 1, wherein said source of forming air is a source of air under pressure.
- 25
4. An I.S. machine according to claim 1, wherein said source of forming air is a source of air under a vacuum.
- 30
5. An I.S. machine according to claim 1, wherein said control means operates said valve means when the parison at bottom of mold signal occurs plus or minus a selected delay.
